

LoanWizard

Bharat Academix CodeQuest 2026 - AI video loan origination prototype

A customer opens a web link, answers a short spoken interview, and receives an instant explainable loan offer. The prototype combines browser perception, a FastAPI/Keras risk service, and a Postgres audit trail built for RBI Video-KYC and DPDP-style consent.

Public HF web demo

Live Keras ML API

Admin audit console

Real-camera local mode

What judges can verify

- Hosted HF web flow: landing, scripted session, offer, e-sign, KFS download.
- Live HF ML service: /health, /docs, /offer, /fairness/report, and /drift endpoints.
- Admin console: session timeline, consent evidence, fairness, drift, and replay.
- Local real-camera path for the recorded demo and technical proof.

Real engineering

- Keras risk MLP and fraud MLP with committed model weights.
- TF.js liveness, document-capture hooks, STT flow, and device fingerprinting.
- Prisma plus SQLAlchemy audit tables with frozen decision snapshots.
- Reason codes, model versions, and plain-language offer narratives.

Demo honesty

- The public judge link uses scripted perception and a mock offer for reliability.
- The real Keras service is live separately and hittable through API docs.
- The recorded demo should show real camera plus real ML scoring locally.
- This separates judging reliability from model verifiability.

Stack

- Next.js 14, React, Tailwind, pnpm, Turborepo.
- FastAPI, TensorFlow/Keras, TensorFlow.js, scikit-learn.
- Prisma, SQLAlchemy, PostgreSQL, Neon, Hugging Face Spaces.

Submission note

Use this CodeQuest-specific one-pager instead of the HACKARENA-branded PASS.pdf unless the full deck is reworked.
